

TM

Equilibrium has made a commitment to reach net zero greenhouse gas emissions by 2050, in keeping with the following targets:

- Net zero across all of Equilibrium's corporate operations by 2025
- Net zero across all of Equilibrium's real asset operations on an aggregate basis by 2030
- Net zero on an asset level by 2050

We are implementing the first stage of our science-based methodology to reach these goals. We recognize that reaching all of them will require a combination of alignment of operating models, innovative R&D, supply chain transformation, and regulatory engagement.

We are also expanding our climate risk analysis across our entire portfolio of assets, not only for the purpose of transparent disclosure, but to drive operational adaptation and resilience.
